Procedures

Participants in all of the new datasets reported here completed surveys that included demographic questions and a dictator game measure of generosity. Participants indicated their income by choosing among several options. We assigned the midpoint of each income category. For participants who chose the top category, we used a formula developed by Hout (2004) to determine the amount. Participants in our MTurk 2016 and 2019 studies reported their home state. We determined the home states of participants from the Human Cooperation Laboratory Study by matching their MTurk IDs to a separate pre-screen survey maintained by one of our laboratories. Participants from the Human Cooperation Laboratory Study were not included in the analyses if they did not report their income, their home state was not available in our prescreen survey, or if they failed a comprehension check for the dictator game. In all studies, participants took part in a dictator game measure in which they could give raffle tickets or money to another participant.

MTurk 2016 Study

Human Cooperation Laboratory Study

Pre-Registered MTurk 2019 Study

Fig. S1. Dictator game giving as a function of income and level of economic inequality in respondents' home states. Lines are projections based on regression estimates from the overall model. The blue, dotted line depicts the projected association between income and dictator game giving in the area with the lowest level of inequality. The pink, dashed line depicts this association in an area with an average level of inequality. The red, solid line depicts this association in the area with the highest level of inequality.
